In the Claims:

73(Currently amended) A communication interface ~~comprising~~ having n data lanes, said interface sequentially transmitting a header including a packet type field describing a payload data type, said header distributed across a plurality of said data lanes, a variable amount of payload data comprising an encapsulated packet having an encapsulated header and encapsulated data, said payload data distributed across ~~a plurality of~~ said n data lanes;

a field check sequence computed over said payload data, concatenated to the end of said payload, and distributed across said n data lanes;

said header includes transmitting a START symbol on first said data lane, and the transmission of said payload data is followed by said field check sequence distributed as bytes across said n data lanes and an END symbol on at least one said data lane;

said payload data includes transmitting successive data bytes canonically across said n successive data lanes up to data lane m, where m<=n;

and said n > 1.

74(Previously presented) The communication interface of claim 73 where said n is 4.

75(Currently amended) A process for transmitting data on a communications channel having a first, a second, a third, and a fourth data lane, each said data lane being 8 bits wide, said data comprising a header which includes a start symbol, payload type field, and variable length payload described by said payload type, said payload further having an encapsulated header and encapsulated payload, said variable length payload followed by a field check sequence computed on said header and also said payload, said field check sequence spanning all said data lanes, the channel transmitting said data on successive clock intervals by sequentially placing said data on said first, said second, said third and said fourth data lane during a particular said clock interval, ~~having a first, a second, a third, and a fourth data lane, each data lane being 8 bits wide and including a clock for transferring said 8 bits,~~ said process comprising the steps:

a first step of sending a synchronization symbol on all four said data lanes ~~for a synchronization interval, or~~ until said variable length payload is ready to be transmitted;

a second step of substantially simultaneously sending said header to said first data lane and part of said payload

to the remaining three said data lanes during a first said clock interval;

a third step of incrementally transmitting the remainder of said payload data in a sequence of transmission events, each said transmission event occurring during a said successive clock interval and comprising ~~substantially simultaneously~~ sending said incremental payload data ~~in~~ distributed across said four data lanes followed by said field check sequence until ~~final~~ unsent ~~data comprising~~ said field check sequence spanning one, two, or three ~~zero data, one data lane, two data lanes, or three data~~ lanes ~~of said payload data~~ remains to be transmitted;

a fourth step of transmitting said ~~final data~~ unsent field check sequence by distributing it across said one, two, or three data lanes accompanied by an END symbol on one said data lane.

76(Currently amended) The process of claim 75 where no said ~~final data~~ unsent field check sequence remains ~~comprises zero said data lanes~~ and said END symbol is transmitted on said first data lane.

77(Currently amended) The process of claim 75 where no said ~~final data~~ unsent field check sequence remains ~~comprises zero said data lanes~~ and said END symbol is

transmitted on said first data lane accompanied by said preamble transmitted on said second, said third, and said fourth data lanes.

78(Currently amended) The process of claim 75 where said ~~final data~~ unsent field check sequence is transmitted on said ~~comprises~~ first said data lane and said END symbol is transmitted on said second data lane.

79(Currently amended) The process of claim 75 where said ~~final data~~ unsent field check sequence is transmitted on said ~~comprises~~ first said data lane and said END symbol is transmitted on said second data lane accompanied by said preamble transmitted on said third and said fourth data lanes.

80(Currently amended) The process of claim 75 where said ~~final data~~ unsent field check sequence is transmitted on ~~comprises~~ said first and said second data lanes and said END symbol is transmitted on said third data lane.

81(Currently amended) The process of claim 75 where said ~~final data~~ unsent field check sequence is transmitted on ~~comprises~~ said first and said second data lanes and said END symbol is transmitted on said third data lane

accompanied by said preamble transmitted on said fourth data lane.

82(Currently amended) The process of claim 75 where said ~~final data~~ unsent field check sequence is transmitted on said ~~comprises~~ first, second, and third said data lanes and said END symbol is transmitted on fourth said data lane.

83(Currently amended) The process of claim 75 where said ~~final data~~ unsent field check sequence is transmitted on ~~comprises~~ said first, said second, and said third data lanes and said END symbol is transmitted on said fourth data lane accompanied by said preamble transmitted on said fourth data lane.

84(Previously presented) The process of claim 75 where each said clock rate is substantially 312.5Mhz.

85(Previously presented) The process of claim 75 where each said clock rate is 156.25Mhz and both a both positive edge and a negative edge are used to transfer said data.

86(Previously presented) The process of claim 75 where each said clock rate is 312.5Mhz and either a positive edge or a negative edge is used to transfer said data.

87(Previously presented) The process of claim 75 where each said data lane is encoded and serialized into a serial stream of data.

88(Previously presented) The process of claim 87 where said encoder is an 8B/10B encoder.

89(Previously presented) The process of claim 87 where said serial stream of data is transmitted as a differential electrical signal.

90(Previously presented) The process of claim 87 where said serial stream of data is transmitted as an optical signal.

91(Currently amended) A transmitter for sending data formed into a stream of 8-bit bytes, the stream comprising a header followed by a variable length payload, said data ~~being~~ substantially simultaneously transmitted on a first data lane, a second data lane, a third data lane, and a fourth data lane in a succession of time sequences~~, wherein said variable length data is incrementally transmitted on said first, said second, said third, and said fourth data~~

~~lanes during each said time sequence~~ in the following manner:

sending a preamble on said first, said second, said third, and said fourth data lanes until said variable length data is ready to transmit, and when said data stream is ready to transmit:

sending a START symbol on said first data lane and said first three successive bytes of data from said stream ~~variable length data~~ on said second, said third, and said fourth data lanes during one said time sequence;

sending the remainder of said ~~variable length payload~~ data stream by sending each subsequent four bytes of unsent data on said first, said second, said third, and said fourth data lanes during successive said time sequences until there is insufficient data to send on all four said data lanes, said insufficient data being final data;

when there is no said final data to send, sending said END symbol on said first lane, and said preamble on said second, said third, and said fourth lanes;

when said final data comprises one said data lane, sending said final data on said first lane, an END symbol on said second lane, and said preamble on said third and said fourth lanes;

when said final data comprises two said data lanes, sending said final data on said first and said second lane,

an END symbol on said third lane, and said preamble on said fourth lane,

when said final data comprises three said data lanes, sending said final data on said first, said second, and said third lane, and an end symbol on said fourth lane.

92(Previously presented) The transmitter of claim 91 where each said data lane is 8 bits wide.

93(Previously presented) The transmitter of claim 91 where each said data lane is 8 bits wide and is clocked at a rate of 312.5Mhz.

94(Previously presented) The transmitter of claim 93 where said 312.5Mhz clock comprises both the positive edge and the negative edge of a 156.25Mhz clock.

95(Previously presented) The transmitter of claim 93 where said 312.5Mhz clock comprises a positive edge or a negative edge of said 312.5Mhz clock.

96(Previously presented) The transmitter of claim 93 where each said data lane includes an encoder and a serializer, each said data lane generating a serialized stream of data.

97(Previously presented) The transmitter of claim 96 where each said data lane includes an encoder receiving data at said time sequence of substantially 312.5Mhz, and each said serializer is clocked at a rate of 10 times said encoder time sequence rate.

98(Previously presented) The transmitter of claim 96 where each said encoder uses 8B/10B encoding.

99(Previously presented) The transmitter of claim 93 where each said data lane comprises 8 bits of data and one bit of clock, said clock operating at a rate of substantially 312.5Mhz.

100(Previously presented) The transmitter of claim ~~93~~ 96 where data from each said data lane is transmitted least significant bit first and most significant bit last.

101(Previously presented) The transmitter of claim ~~93~~ 96 where data from each said data lane is transmitted most significant bit first and least significant bit last.

102(Currently amended) A transmitter for generating four streams of serial data, said transmitter including:

a transmit buffer for receiving ~~32 bits of~~ data and a separator for separating said ~~32 bits of~~ data into four data lanes, said data having, in sequence, a header including a payload type field, a payload which includes an encapsulated header and encapsulated packet of a type described by said payload type field, and a field check sequence computed from said header and said payload, each said data lane ~~each~~ comprising 8 bits of data and a clock operating at substantially 312.5Mhz;

said separator generating said four data lanes by prepending a START delimiter to the beginning of said data and appending an END delimiter to the end of said data, thereafter forming a succession of four bytes of unsent data and applying each of said four bytes of unsent data to a particular said data lane;

each data lane having:

an encoder for converting said 8 bits of data accompanied by said clock into 10 bits of encoded data;

a serializer for transmitting said 10 bits of encoded data into a stream of serial data clocked at 10 times said encoder clock rate.

103(Currently amended) A receiver for converting four streams of serial data into a series of 32 bit words for storage into a buffer, each said serial stream operating at substantially 3.125 Ghz, said receiver having:

four input data processors, each said data processor having:

a deserializer for converting a stream of serial data into said 10 bits of parallel encoded data and a clock at substantially 312.5Mhz;

a decoder for converting said 10 bits of parallel encoded data into 8 bits of decoded data;

a ~~transmit buffer~~ separator coupled to each said ~~decoder and each said clock, said transmit buffer~~ data processor, said separator forming a recovered packet in said buffer by detecting a START symbol on a particular lane, thereafter transferring data including a header having a field identifying a payload type, a payload identified by said payload type, and a received field check sequence from said data processor until the receipt of an END symbol, converting said 8 bits of decoded data from each said decoder and each said clock into a succession of said 32 bit words.

104(Currently amended) A receiver for ~~converting~~ receiving four streams of serial data and converting said

four streams of serial data into a variable length ~~data payload~~packet, said receiver comprising:

four deserializers, each said deserializer coupled to a respective serial stream, each said deserializer converting said stream of serial data into 10 bits of encoded data accompanied by a clock for each said serial stream;

four decoders, each said decoder coupled to a respective said deserializer output, each said decoder converting each said 10 bits of encoded data into 8 bits of decoded data, thereby producing 8 bits of decoded data accompanied by a clock;

an elasticity buffer coupled to each said 8 bit decoder data and decoder clock, said elasticity buffer receiving ~~32~~ 8 bits of data from each decoder at a rate of substantially 312.5Mhz, and combining said decoder clock and data to form 32 bits of output data over successive intervals,

a packet generator coupled to said elasticity buffer output data and responsive to a START delimiter on a particular one of said four streams and an END delimiter on any said stream, where said END delimiter is accompanied by preamble symbols on at least one other stream, said packet generator forming said packet including a header, a payload, and a field check sequence by canonically concatenating data received from a first stream, second stream, third stream, and fourth stream into said stream of 32 bits of data, said

packet header containing a type field which identifies a particular type of said packet payload, said packet payload including an encapsulated header and an encapsulated payload. ~~to produce said variable length packet.~~

105(Previously presented) The receiver of claim 104 where said decoder is an 8B/10B decoder.

106(Previously presented) The receiver of claim 104 where said variable length payload is formed using data received on the other three said decoders following a START symbol on one said decoder, thereafter using data from all four said decoders until receipt of an END symbol on any said decoder.

107(Previously presented) The receiver of claim 104 where said variable length payload is formed using data between a START symbol on one said decoder and an END symbol received on any said decoder.

108(Previously presented) The receiver of claim 104 where said elasticity buffer forms said variable length payload by concatenating data received from a first decoder, a second decoder, a third decoder, and a fourth decoder, where a START symbol is received on a first decoder and said

variable length packet is formed from concatenating said data in sequence from said second decoder, said third decoder, said fourth decoder, and said first decoder, repeating until terminated by the receipt of an END symbol on any decoder.

109(Previously presented) The receiver of claim 104 where each said serial stream of data is derived from a differential electrical signal.

110(Previously presented) The receiver of claim 104 where each said serial stream of data is derived from an optical signal.

111(Previously presented) The receiver of claim 104 where said 312.5Mhz clock is the result of using both the rising edge and falling edge of a 156.25Mhz clock.

112(Currently amended) A process for generating a variable length packet from four streams of serial data, the process comprising:

deserializing each said serial stream into 10 bit encoded data, thereafter converting said 10 bit encoded data into four data lanes of 8 bit data, and forming a variable length packet as follows:

a first step of receiving a START symbol on said first data lane and said ordered variable length data on said second, said third, and said fourth data lanes during one said time sequence;

a second step of receiving the remainder of said variable length payload on said first, said second, said third, and said fourth data lanes during successive said time sequences until an END symbol is detected on one of said data lanes accompanied by payload data on at least one data lane and a preamble on at least one other data lane;

~~thereby~~ a third step of forming a variable length packet from said data from said START symbol to said END symbol, also maintaining the order of said data received on said first, said second, said third, and said fourth data lanes;

a fourth step of extracting a packet header including a packet type and a payload identified by said packet header type;

a fifth step of extracting an encapsulated header and an encapsulated packet from said payload according to said packet header type.

113(Previously presented) The process of claim 112 where each said decoder is a 10B/8B decoder.

114(Previously presented) The process of claim 112 where each said 8 bit wide data lane is clocked at substantially 312.5Mhz.

115(Previously presented) The process of claim 112 where each said data lane is clocked at substantially 1/10th the rate of each said serial data.

116(Previously presented) The process of claim 114 where said 312.5Mhz clock comprises using either the rising edge or the falling edge of a 312.5Mhz clock.

117(Previously presented) The process of claim 114 where said 312.5Mhz clock comprises using both the rising and falling edge of a 156.25Mhz clock.

118(Previously presented) The process of claim 112 where each said serial stream of data is derived from a differential electrical signal.

119(Previously presented) The process of claim 112 where each said serial stream of data is derived from an optical signal.
